

Introduction

PReS 1.8 is the result of Objectif Lune's commitment to make life easier for users. OL has made it its mission to improve the overall efficiency of its software in order to meet customers' expectations.

PReS Connect 1.8 offers new features that will make your life easier by reducing the need for scripting and making more functions available through the user interface.

Improved usability & wizards

Accessing the Connect-managed File Store

The File Store is an internal structure that allows users to store files needed in the workflow. Before 1.8, only advanced users were capitalizing on the full potential of the File Store because it required scripting. Now in 1.8, a simple drag and drop does it.

New wizard for conditional print section

Now in 1.8, it's never been easier to personalise content. Including or excluding whole sections of content is set-up using a user-friendly wizard.

Dynamic finishing

A completely new Editor makes dynamic finishing settings easier than ever.

More options for managing sample data

Adding sample data, or accessing it has been simplified a lot. A lot of time is saved by simply being able to copy / paste sample data to and from the data samples list and windows folders, making QA easier during development process.

Improvement for COTG implementations

PReS Connect works with our Capture OnTheGo solution, allowing companies to initiate automated business workflows from anywhere. Using an e-form on a mobile device, employees can capture data and information in the field.

Using JSON with COTG

Converting XML to JSON and vice-versa is now possible, without using the DataMapper. This improves performance by removing a step during processing.

JSON files do not need to be processed by the DataMapper, allowing content to be generated even faster, enhancing response time in interactivity situations.

Capture OnTheGo Repository

Capture OnTheGo allows to set expiry dates for documents, but so far didn't have the ability to easily delete documents as soon as they were returned and handled. With this, the overview of open documents will be much clearer, and the amount of information stored that is actually no longer needed reduced.

Automatic data entry

The Capture OnTheGo library has been updated so that it can automatically trigger filling in of certain information, using device specific metadata. Information such as the date, time and location can automatically be filled in, reducing errors and omissions.

Output improvements

PReS Connect 1.8 contains a number of important enhancements for output. Here are some highlights:

- **More control over PDF optimization decisions**
For sophisticated colour management, it is now possible to choose between applying the default PDF optimisation step, or to use the PDF as is, if it was already optimised with device specific requirements.
- **Overprint for spot colours**
There is now more control over spot colour printing.
- **Copy fit**
For commercial VDP applications, the copy fit feature allows to maximize the font size to fit text in a certain area or even resize a portion of text in the box so that the box is filled up.
