

PrintShop Mail Connect

OL™ Software

What's new in 1.8?

Introduction

PrintShop Mail 1.8 is the result of Objectif Lune's commitment to make life easier for users. OL has made it its mission to improve the overall efficiency of its software in order to meet customers' expectations.

PrintShop Mail Connect 1.8 offers new features that will make your life easier by reducing the need for scripting and making more functions available through the user interface.

Improved usability and wizards

New wizard for conditional print section

Now in 1.8, it's never been easier to personalize content. Including or excluding whole sections of content is set up using a user-friendly wizard.

Dynamic finishing

A completely new Editor makes dynamic finishing settings easier than ever.

Highlights

Performance improvement

The overall output speed has been improved by speeding up the throughput speed (datamapping, content creation). Now users see an increase in overall performance after they press Print.

Excel input

PrintShop Mail Connect 1.8 now supports XLS and XLSX files natively. There's no need to save XLS files as CSV before using them.

First-Page-Out time decreased

Print jobs can now start more rapidly thanks to higher interpretation speed of the software regarding the print execution.

Output improvements

PrintShop Mail Connect 1.8 contains a number of important enhancements for output. Here are some highlights:

- **More control over PDF optimization decisions**
For sophisticated colour management, it is now possible to choose between applying the default PDF optimisation step and using the PDF as is, if it was already optimized with device-specific requirements.
- **Overprint for spot colours**
There is now more control over spot colour printing.
- **Copy fit**
For commercial VDP applications, the copy fit feature allows users to maximize the font size to fit text in a certain area or even resize a portion of text in the box so that the box is filled up.
